Anthos

Expect Extraordinary
Deploy your first Anthos workload in just 4 weeks.

Our Agile Systems Integrator approach combined with our tried-and-tested accelerator frameworks and in-depth Java experience means we can rapidly and reliably modernise your applications with Anthos, regardless of whether they sit in multiple clouds or on-premises.

.

Pick and Prove
We help you choose your first workload - then we deploy it through Anthos to Google, AWS or your on-premise environments in just 4 week. Here is how it works in six steps..
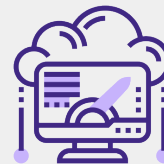

1

Introduction to application modernisation, the Google Anthos platform and related services
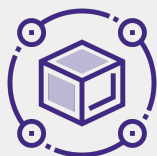

2

Agile 1-day discovery workshop to determine business objectives for moving to Anthos, including identification of target workload and target location (on-prem, Google or AWS)

3

Agreement of high-level outcomes and prioritisation of tasks to meet those outcomes. The Appsbroker methodology we use ensures that the pilot will meet both the business objectives and the IT department's needs for a supportable service

4

Establishment of IT prerequisites for GKE (Google Kubernetes Engine) on-prem - if on-prem workload is selected. Appsbroker and Google will ensure your on-premise environment is ready for GKE on-prem

5

Anthos platform deployment in your chosen location (on-premises, Google Cloud platform or AWS)

6

Following agile kanban methodologies, we work collaboratively with the customer's business and IT stakeholders to complete the prioritised tasks for the pilot with daily standups to communicate progress, demos and milestones

Let's Get Solving - Get in touch to start your first modernisation.
